# On Objectives and Some Results of Russian Satellite Laser Ranging Network Operation in 2013

Vladimir Glotov , Nataly Parkhomenko

11-15 Nov 2013 , Fujiyoshida, Japan

## Main Goals of the Russian SLR Network

- Creating and monitoring of the high-precision geodetic reference system for GLONASS base on the measurements from collocated SLR, VLBI and one-way measuring stations (to the availability with ITRF, GPS/GALILEO/COMPASS/... reference systems)
- Estimation of delivering errors of the state geocentric reference system by GLONASS navigation field
- Precise monitoring of the calculating Glonass satellites' orbit and clock data (onboard and others)
- Measurement of time scale differences at remote stations using differences between the stations and the onboard time scales of the same Glonass S/C
- Calibration of one-way/two-way radio and technical systems
- National and ILRS missions support

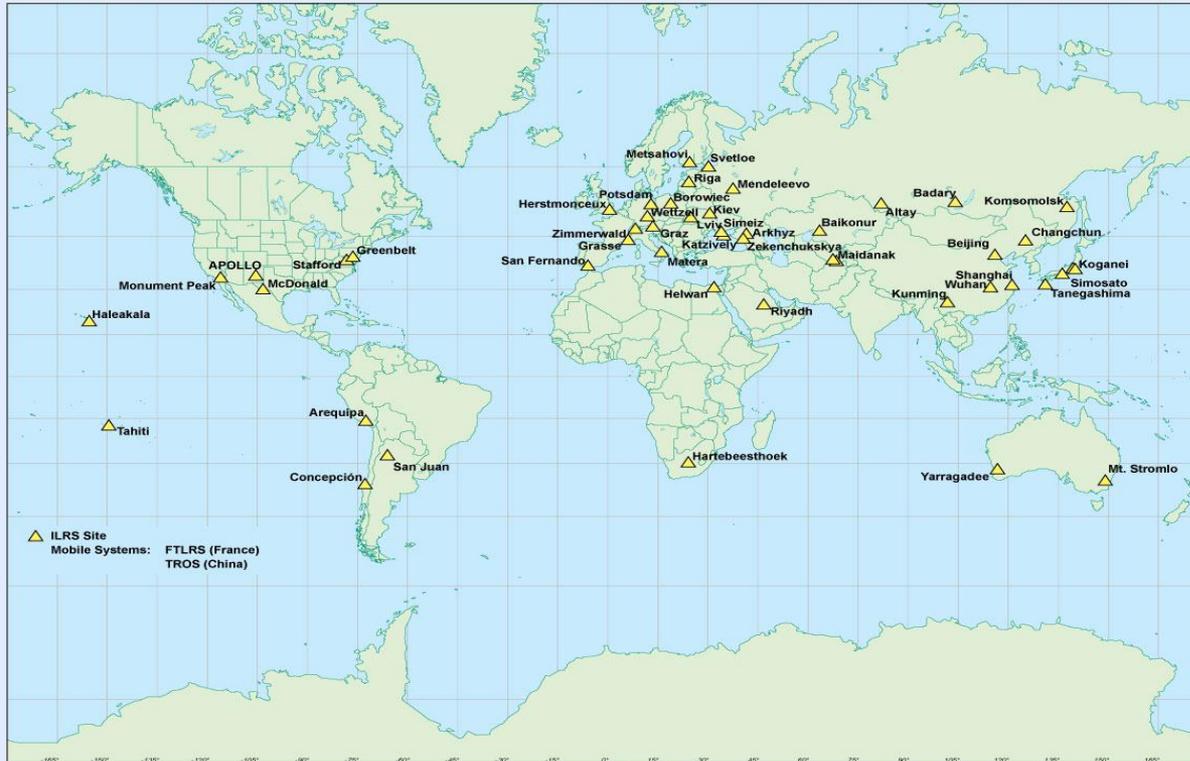

РОСКОСМОС

# ILRS Global Network

Currently measurements are obtained from 39 stations of the ILRS Network including stations of the Russian Network – Altay, Komsomolsk, Arkhyz, Baikonur, Svetloe, Zelenchukskaya, Badary as well as Mendeleevo and Irkutsk (experimental mode)

# New Russian SLR stations

## RUSSIAN DoD

- Altay
- Komsomolsk

## RUSSIAN SPACE AGENCY

- Arkhys
- Baikonur

## RUSSIAN ACADEMY OF SCIENCES

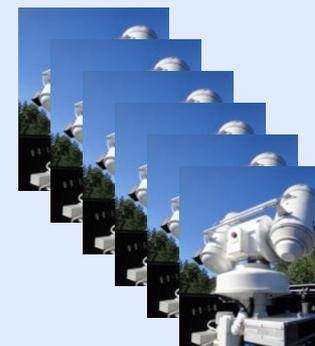

- Badary
- Svetloe
- Zelenchukskaya

## RUSSIAN AGENCY OF STANDARDIZATION

- Mendeleevo
- Irkutsk

## RUSSIAN AGENCY OF GEODESY

- New stations

## Information and Analysis Center for Positioning, Navigation and Timing (Previous/other name – Mission Control Center- MCC)

### Experience and Current Status (operation with SLR data in the form of permanent service)

- Russian SLR Network Operational Center since 1990
- IERS Analysis Center since 1994
- In frame of ILRS activity since 1997
- In frame of IGS activity since 2005 (as IAC – microwave data processing for Precise Orbit&Clock Determination)

# Information and Analysis Center for PNT

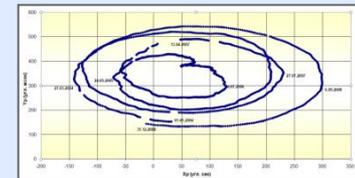

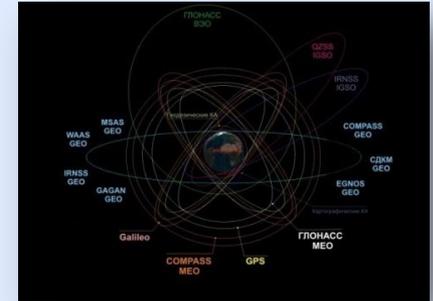

## Within Russian SLR Network :

- ❑ Operations planning of Russian SLR stations based on the priorities
- ❑ CPF format calculation for Russian missions
- ❑ Collecting and storing SLR data obtained from the stations
- ❑ “Normal points” generating according to CRD
- ❑ Precise quality control of Russian SLR stations
- ❑ Measurement data delivering to Russian users and international centers for data collection, storage and analysis

## Within ILRS operations:

- ❑ Processing of the obtained measurements including Earth orientation parameters determination and Glonass satellites' precise orbit and clock determination
- ❑ Precise monitoring of ILRS Network measurement accuracy
- ❑ Information interaction between ILRS, IERS, EDC, HTSI Centers of SLR data collection, storage and analysis

# Future plans

## Support of the GNSS performance:

- *GLONASS* is fully loaded Global Navigation Satellite System
- All GLONASS satellites have retroreflectors
- Many future GNSS satellites (Compass, GALILEO, GPS, ...) will be equipped with retroreflector arrays
- Necessity to the improvement of the time, frequency, reference system and ephemeris data products from GNSS
- Necessity to support of GGOS project and multi-constellation GNSS receivers (Glonass, GPS, Compass, etc)

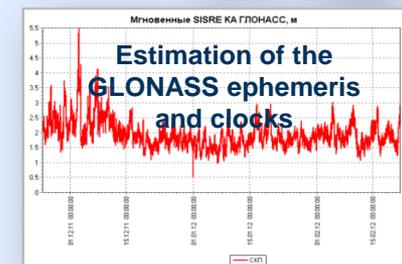

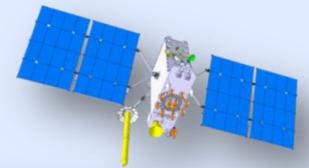

**The increasing importance of SLR to the improvement of GNSS performance**
